Canada's main stock index futures fell to a three-week low on Thursday, weighed by weakness in gold prices and as concerns about a stunted global economic recovery dented demand for world equities.

This book demonstrates the power of neural networks in learning complex behavior from the underlying financial time series data. The results presented also show how neural networks can successfully be applied to volatility modeling, option pricing, and value-at-risk modeling. These features mean that they can be applied to market-risk problems to overcome classic problems associated with statistical models.

The credit derivatives market is booming and, for the first time, expanding into the banking sector which previously has had very little exposure to quantitative modeling. This phenomenon has forced a large number of professionals to confront this issue for the first time. Credit Derivatives Pricing Models provides an extremely comprehensive overview of the most current areas in credit risk modeling as applied to the

pricing of credit derivatives. As one of the first books to uniquely focus on pricing, this title is also an excellent complement to other books on the application of credit derivatives. Based on proven techniques that have been tested time and again, this comprehensive resource provides readers with the knowledge and guidance to effectively use credit derivatives pricing models. Filled with relevant examples that are applied to real-world pricing problems, *Credit Derivatives Pricing Models* paves a clear path for a better understanding of this complex issue. Dr. Philipp J. Schönbucher is a professor at the Swiss Federal Institute of Technology (ETH), Zurich, and has degrees in mathematics from Oxford University and a PhD in economics from Bonn University. He has taught various training courses organized by ICM and CIFT, and lectured at risk conferences for practitioners on credit derivatives pricing, credit risk modeling, and implementation.

There is a need for fundamental changes in the ways society views electric energy. Electric energy must be treated as a commodity which can be bought, sold, and traded, taking into account its time-and space-varying values and costs. This book presents a complete framework for the establishment of such an energy marketplace. The framework is based on the use of spot prices. In general terms:

- o An hourly spot price (in dollars per kilowatt hour) reflects the operating and capital costs of generating, transmitting and distributing electric energy. It varies each hour and from place to place.
- o The spot price based energy marketplace involves a variety of utility-customer transactions (ranging from hourly varying prices to long-term, multiple-year contracts), all of which are based in a consistent manner on hourly spot prices. These transactions may include customers selling to, as well as buying from, the utility. The basic theory and practical implementation issues associated with a spot price based energy marketplace have been developed and discussed through a number of different reports, theses, and papers. Each addresses only a part of the total picture, and often with a somewhat different notation and terminology (which has evolved in parallel with our growing experience). This book was xvii xviii Preface written to serve as a single, integrated sourcebook on the theory and implementation of a spot price based energy marketplace.

This monograph is devoted to the identification and measurement theory of costs and benefits in a fuzzy information environment. The process of cost-benefit analysis is presented, requiring the development of real cost-benefit databases and the construction of cost-benefit criterion. These steps are accomplished with various theoretical constructs that provide sets of self-contained algorithms for application. This book integrates cost-benefit analysis, theory of fuzzy decisions and social decisions into unified decision algorithms accessible to practitioners, researchers, and graduate students. It features the essentials of fuzzy mathematics and algorithms in a comprehensive way, exposing a multi-disciplinary approach for the development of cost-benefit decision making in the framework of fuzziness and soft computing.

Why the traditional "pledge and review" climate agreements have failed, and how carbon pricing, based on trust and reciprocity, could succeed. After twenty-five years of failure, climate negotiations continue to use a "pledge and review" approach: countries pledge (almost anything), subject to (unenforced) review. This approach ignores everything we know about human cooperation. In this book, leading economists describe an alternate model for climate agreements, drawing on the work of the late Nobel laureate Elinor Ostrom and others. They show that a "common commitment" scheme is more effective than an "individual commitment" scheme; the latter depends on altruism

while the former involves reciprocity ("we will if you will"). The contributors propose that global carbon pricing is the best candidate for a reciprocal common commitment in climate negotiations. Each country would commit to placing charges on carbon emissions sufficient to match an agreed global price formula. The contributors show that carbon pricing would facilitate negotiations and enforcement, improve efficiency and flexibility, and make other climate policies more effective. Additionally, they analyze the failings of the 2015 Paris climate conference. Contributors Richard N. Cooper, Peter Cramton, Ottmar Edenhofer, Christian Gollier, Éloi Laurent, David JC MacKay, William Nordhaus, Axel Ockenfels, Joseph E. Stiglitz, Steven Stoff, Jean Tirole, Martin L. Weitzman

During the last decade the European Commission has progressively adopted what is called a "more economic approach" toward competition policy. This approach, which draws on U.S. antitrust policy, puts greater emphasis on possible welfare effects of business practices and is less concerned with competitive market structures. Under this school of thought concentration cannot be said to impede effective competition to the extent that efficiency gains outweigh market distortions. In order to stimulate the debate on this basic reorientation, in January 2009 the Max Planck Institute for Comparative and International Private Law at Hamburg convened economists, legal scholars, and practitioners for an exchange of views on these "new" methodological foundations of EU competition policy and competition law. Two especially controversial elements were chosen for in-depth discussion: the prohibition of abuses of dominant positions and the review of State aid. This book reproduces fourteen papers from this conference, representing the considered views of prominent European lawyers, economists, academics, policymakers, and enforcement officials in the competition field on matters such as: the objectives of EU competition law; the current enforcement guidelines of the EU Commission regarding Article 102 TFEU and? measuring market power; abusive low pricing strategies; the economics of competition law enforcement; recent developments in EU State aid law; economic justifications for State aid. A critical assessment of the Commission's State aid action plan by the German Monopolies Commission is appended in English. Applying law and economics theory to competition law, this book shows that the "more economic" approach is exerting a considerable impact on various sectors of competition law. The authors clearly demonstrate the progress that can be made when lawyers and economists take notice of and respect the characteristics of each other's discipline. Moreover, the authors show how new insights of economic theory may be integrated into the relevant legal analysis. The book will therefore be appreciated by academics, practitioners, and officials representing both fields.

Internal Pricing surveys of the transfer pricing literature with a focus on commonly-used pricing schemes using incomplete contracting models. Chapter 2 develops the basic symmetric information model to compare the performance of cost-based and negotiated pricing in the absence of external input markets. Chapter 3 considers market-based pricing and the role of internal price adjustments; it ignores investments and focuses solely on trading incentives. Chapter 4 adds investments to the model of Chapter 3 and shows that investment opportunities further strengthen the case for internal adjustments. Chapter 5 reconsiders the initial analysis of Chapter 2 for the case of

asymmetrically informed divisional managers. The book ends with the author's conclusions and an appendix including the mathematical proofs. A key theme running through Internal Pricing is that the firm's central office (i.e headquarters) plays a rather limited role in mediating individual transactions. This captures the stylized empirical fact that in most firms, headquarters designs the broad "rules of the game" by choosing a pricing mechanism and compensation contracts, but usually does not get involved in pricing on a product-by-product basis.
