<p>Presents an in-depth interdisciplinary discussion of the concept of information and its role in the control of natural processes. Reviews briefly classical and quantum information theory. Addresses numerous questions, including: Is information reducible to the laws of physics and chemistry? Does the Universe, in its evolution, constantly generate new information? Or are information and information-processing exclusive attributes of living systems, related to the very definition of life? If so, what is the role of information in classical and quantum physics? In what ways does information-processing in the human brain bring about self-consciousness? Accessible to graduate students and professionals from all scientific disciplines, this stimulating book will help to shed light on many controversial issues at the heart of modern science.</p>
<p>Young traces the evolution of the term information from its general linguistic use into the mainstream of modern science, proposing an entirely new definition of information as a mass-energy phenomenon. He demonstrates that: information is in all cases a form phenomenon; both form and information are mass-energy rather than abstract phenomena; mind can be viewed as a mass-energy rather form-manipulating process; form constitutes a mechanism immanent in the physical universe via which mass-energy systems can communicate informationally and control their own energetic activities.</p>
<p>Information is an important concept that is studied extensively across a range of disciplines, from the physical sciences to genetics to psychology to epistemology. Information continues to increase in importance, and the present age has been referred to as the "Information Age." One may understand information in a variety of ways. For some, information is found in facts that were previously unknown. For others, a fact must have some economic value to be considered information. Other people emphasize the movement through a communication channel from one location to another when describing information. In all of these instances, information is the set of characteristics of the output of a process. Yet Information has seldom been studied in a consistent way across different disciplines. Information from Processes provides a discipline-independent and precise presentation of both information and computing processes. Information concepts and phenomena are examined in an effort to understand them, given a hierarchy of information processes, where one process uses others. Research about processes and computing is applied to answer the question of what information can and cannot be produced, and to determine the nature of this information (theoretical information science). The book also presents some of the basic processes that are used in specific domains (applied information science), such as those that generate information in areas like reasoning, the evolution of informative systems, cryptography, knowledge, natural language, and the economic value of information. Written for researchers and graduate students in information science and related fields, Information from Processes details a unique information model independent from other concepts in computer or archival science, which is thus applicable to a wide range of domains. Combining theoretical and empirical methods as well as psychological, mathematical, philosophical, and economic techniques, Losee's book delivers a solid basis and starting point for future discussions and research about the creation and use of information.</p>

<p>The Evolution of Meaning is based upon the premise that the Universe consists of information processing events. 'Information' is to be understood here not in the bare mathematical sense, but in the full active life/observation/meaning sense. From this viewpoint, the scientific description of Nature is seen to involve not only the fabric of spacetime, material aggregates and the forces acting between them, but also various equally real and fundamental groups of laws and law-like entities, as well as the concepts of subjectivity and value-oriented essential dimensions. Each of these fundamental parameters is shown to comprise four sub-parameters; all of them together forming a well-structured Tree of Everything which leads on to both testable scientific predictions, and to sensible conjectures about man's place in the world. The Universe constitutes a self-unfolding and meaningful story in which events do not pass away into non-existence but instead remain forever as an indelible part of the whole.</p>

<p>This book questions the nature of the business and social information systems so ubiquitous in contemporary life. Linking positivism, individualism, and market-fundamentalist economics at the root of these systems, it critiques the philosophical ground of this triumvirate as fundamentally against nature. Connecting counter-philosophies of the subject as a natural part of existence, with more collectivist and ecological economics, it presents a historical critique of the development of the academic field of information systems and offers a complex view of the nature of Nature through which we might reshape our approach to technology and to our economies to overcome the existential threat of climate change. As such, it will appeal to philosophers, social theorists, and scholars of science and technology studies with interests in the environment and ecology, as well as those working in the field of information systems.</p>
<p>The aim of this book is to discuss the fundamental ideas which lie behind the statistical theory of learning and generalization. It considers learning as a general problem of function estimation based on empirical data. Omitting proofs and technical details, the author concentrates on discussing the main results of learning theory and their connections to fundamental problems in statistics. This second edition contains three new chapters devoted to further development of the learning theory and SVM techniques. Written in a readable and concise style, the book is intended for statisticians, mathematicians, physicists, and computer scientists.</p>
