Substitution and elimination reactions are among the most common in organic chemistry. It is key to understand how and when these reactions happen. This section focuses on three concepts necessary for an understanding of substitution and elimination: the rate law, the leaving group, and the nucleophile. The Rate Law

Dissociative nucleophilic substitution: the S_N1 reaction. A second model for a nucleophilic substitution reaction is called the 'dissociative', or ' S_N1 ' mechanism: in this picture, the C-X bond breaks first, before the nucleophile approaches: This results in the formation of a carbocation: because the central carbon has only three bonds, it bears a formal charge of +1.

27.2: Introduction to Substitution Reactions - Chemistry ...

Nucleophilic substitution reactions and electrophilic additions, together with elimination reactions, are generally all the reactivity covered in any introduction to organic chemistry courses. To further dive into the concept of electron density, let's look back at our first example in the previous section.

A nucleophilic aromatic substitution reaction is a reaction in which one of the substituents in an aromatic ring is replaced by a nucleophile. A Meisenheimer complex is a negatively charged intermediate formed by the attack of a nucleophile upon one of the aromatic-ring carbons during the course of a nucleophilic aromatic substitution reaction.
