Of the trials with a parallel-group design, excluding those with a factorial design (n = 221, 74.2%), 82 (37.1%) were dose-response trials (use of multiple doses of the same treatment) and 139 (62.9%) compared different treatments. Trials with three arms (n = 172) included several types of interventions and control arms (Figure 2).

Three such quantitative assessment tools include the percentage of edges correctly identified as edges, the percentage of false edges, and Pratt's edge quality metric. Given ground truth edge information, usually with synthetic data, one may measure the correlation between the ideal edge map and the computed edge map.

Background: Chitosan is a popular dietary fiber often used to reduce dietary fat absorption to control weight and blood lipids. However, its effects on blood pressure (BP) have not been fully elucidated. We evaluated the effects of chitosan administration on systolic blood pressure (SBP) and diastolic blood pressure (DBP) through a pooled analysis of available randomized controlled trials (RCTs).
